

"Thanks — so we just heard about the three core elements that make up data storytelling: data, visuals, and narrative. That naturally leads to the next question: how do we actually put those three elements into practice and turn raw numbers into a story?"

Slide 5 – Turning Data Into a Story

"According to an article by Sean Dougherty on Funnel.io, this process comes down to a few key steps.

First, know your audience — understand who you're talking to, how much they already know, and what metrics actually matter to them. A finance director and a marketing intern won't care about the same numbers.

Second, set a clear narrative goal. Before you build a single chart, decide: what's the one main point I want people to walk away with?

Third, organize your data logically — structure it so it naturally leads your audience step by step toward your conclusion, instead of throwing all the numbers at them at once.

And finally, add context through annotations and clear titles. Instead of a generic title like 'Sales in Q3,' the article gives an example like 'Smashed sales targets by 120% with \$X in profit' — a title that immediately tells the audience why the chart matters."

Slide 6 – Example

"To make this concrete, the article walks through a simple before-and-after comparison.

Imagine this raw data: a campaign reached 500,000 users, a 3% click-through rate, 15,000 conversions, and a 250% ROI. On their own, these are just numbers — technically impressive, but they don't tell a story.

The 'before' version most people present is: 'Traffic increased by 20% this month.' Fine, but it doesn't inspire any action.

The 'after' version reframes that same 20% boost as coming from a specific targeted campaign, connected to a concrete outcome — around 500 new leads, translating into \$55,000 in additional revenue.

Notice the difference — the first version just states a number. The second ties that number to a cause, and then to a business result. That's the whole idea behind data storytelling: connecting data to a reason and an outcome so the audience immediately understands why it matters."

Closing

"So we've now seen how to build the story itself — but even the best story can fall flat if it's shown with the wrong chart. Choosing the right visual is just as important as the story behind it, and that's exactly where I'll hand things over to [اسم الشخص الرابع], who'll walk us through how to choose the right chart for the story you're trying to tell."
